# iOS Programming Assignment 4 (25 points)

Create a Single View Application within a folder titled "Assignment4".

The behavior of the application should be as follows:
- User will be able to attempt to select 3 numbers using a UIPickerView control.
- Clicking the Try button will test the selected numbers against the hardcoded "combination".
- If the selected numbers match against the correct combination, an Alert View should pop up with a secret message.
- Clicking the Auto button will select the appropriate sequence of numbers to match the correct combination.
- Feel free to change the "purpose" of the application, as long as the number and type of controls remain the same.
- Take into consideration layout – what does the application look like when in portrait mode?
- **Use appropriate naming for Project, Class Prefix, Outlets and Actions!**

The project files should be pushed to your private repository on GitHub. Please submit your github account and the folder name via Blackboard for grading purposes. Include appropriate comments!
